CYLINDRICAL GRINDING

STELLA has experience in producing precision grinding wheels for more than 80 years. By means of special combinations of high-quality abrasive grain types, improved vitrified bonds and innovative manufacturing processes a new generation of conventional grinding tools has been designed: **STELLA select (STs)**.

In order to achieve optimal cutting features for cylindrical grinding we use abrasive grain compositions of sintered aluminium oxide and special corundums (e.g. monocrystalline or ruby fused aluminium oxide). Highest porosity that is matched to the grinding task by its size and distribution abets the chip removal.

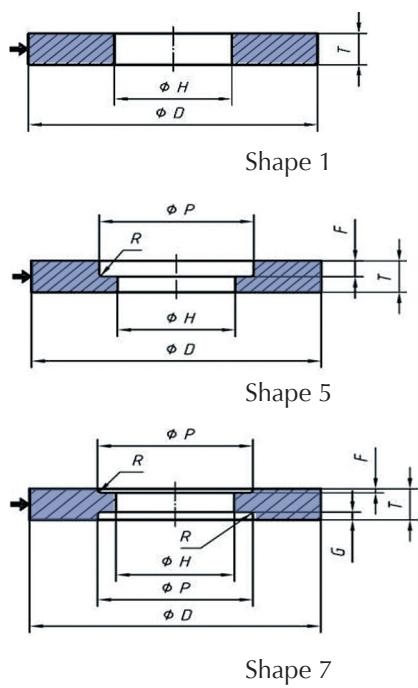

Special vitrified bonding systems which are adjusted to the particular grinding application by their elasticities, consistencies and their flowability ensure that the selected abrasive grains are integrated in an optimal way into the abrasive wheel's matrix.

What are the distinctive features of **STs**-grinding wheels?

They do not have only a high and constant cutting efficiency but also a very good form retention in connection with an optimal and economic utilization of the abrasive grains. Due to expanded dressing cycles the grinding process times are shortened and the wheel's lifetime is extended. The cool cutting effect is an additional important advantage.
